ENSURING SAFETY COMPLIANCE AT YOUR FIELD LOCATION

Overview

You’ve experienced this scenario before. Your field service technician shows up at the work site to discover your company’s safety standards haven’t been met, or his certification has expired, and the job cannot be completed as necessary. The project is on hold, his other scheduled jobs are delayed as he scrambles to rectify the situation, your customers are unhappy and your profitability is negatively affected.

In the oil and gas industry, safety, certifications of all types, and various governmental compliance requirements are crucial to success. From OSHA standards, E&P customer requirements, to DOT regulations, there could be hundreds of procedures you must follow just to complete the maintenance and repair orders you receive in a week.

With ten, twenty, even forty technicians’ training and certifications to keep track of, trying to maintain a log or spreadsheet is a losing battle, fraught with human errors and inefficiency.

Automatic Tracking

Oildex OSS’ Safety module allows your employees to maintain a secure, online profile to manage their individual training and certification needs. Having all records in one central location—in the Cloud for improved accessibility—means that the information can be viewed at any time. Automatic reminders prevent the scrambling and rescheduling when the technician assigned to a job is suddenly not qualified, and allows the employee to register for training and certification classes before expiration cuts into your productivity.

Standard and Customizable Forms

Instead of providing new employees with a binder of safety manuals and standards for your operation, provide a link to the online company manual, as well as individual information for each asset and job location. Safety Report forms have the same options, and their mobile and online availability allows technicians to report on conditions at the jobsite, so any discrepancies are noted in real-time in order that corrections can be made quickly.
Safety Managers

If you are the company safety manager, you can set up to receive weekly notifications on expiring certifications, upcoming trainings, and safety violations before they become crises. Generate reports in real-time so when you need to provide proof and share results with other managers, your information is accurate and up-to-date.

With the Oildex OSS Safety Module, you can:

- Add and monitor qualifications for employees
- View a color-coded dashboard to see overdue and expiring qualifications
- Receive weekly email notification of upcoming and expired qualifications
- Maintain and expiration calendar with day, week, and month views
- Utilize pre-built safety forms
- Develop optional custom safety forms to fit specific customer requirements
- Download and export tables to Microsoft Excel for audit and reporting purposes

The Safety module ensures you are on top of compliance and certification easily and across multiple locations and offices. Working along with other Oildex OSS modules, you can customize the software to fit your existing business processes with smooth integration, or easily transfer your data and customized forms to the entire system. Increase productivity and efficiency, and reduce human error and hazard risk with our easy-to-use, automated system.
